

Chapter 13 Outline

- Object-Oriented Design with Interaction Diagrams
- Use Case Realization with Communication Diagrams
- Use Case Realization with Sequence Diagrams
- Developing a Multilayer Design
- Updating and Packaging the Design Classes
- Design Patterns

Learning Objectives

- Explain the different types of objects and layers in a design
- Develop communication diagrams for use case realization
- Develop sequence diagrams for use case realization
- Develop updated design class diagrams
- Develop multilayer subsystem packages
- Explain design patterns and recognize various specific patterns

Overview

- Chapter 12 introduced software design concepts for OO programs, use case realization using the CRC cards technique, and fundamental design principles
- This chapter continues the discussion of OO software design at a more advanced level
- Three layer design is demonstrated using communication diagrams, sequence diagrams, package diagrams, and design patterns
- Design is shown to proceed use case by use case, and within each use case, layer by layer

OOD with Interaction Diagrams

- CRC Cards focuses on the business logic, also known as problem domain layer of classes
- Three layers include view layer, business logic/problem domain layer, and data access layer
- Questions that come up include
 - How do objects get created in memory?
 - How does the user interface interact with other objects?
 - How are objects handled by the database?
 - Will other objects be necessary?
 - What is the lifespan of each object?

OOD with Interaction Diagrams

- Use case realization
 - The process of elaborating the detailed design for a particular use case using interaction diagrams
- Communication diagram
 - A type of interaction diagram which emphasizes the set of objects involved in a use case
- Sequence diagram
 - A type of interaction diagram which emphasizes the sequence of messages involved in a use case

Use Case Controller

- Switchboard between user-interface classes and domain layer classes
- Reduces coupling between view and domain layer
- A controller can be created for each use case, however, several controllers can be combined together for a group of related use cases
- It is a completely artificial class – an artifact

Understanding Communication Diagrams

- Actor – the external role of the person or thing that initiates the use case. Sends messages.
- Object – the instantiated class objects that perform the actions (methods) to execute the use case. They receive messages and process messages.
- Link – simply connectors between objects to carry the messages.
- Message – the requests for service with an originating actor or object and a destination object, which performs the requested service

Message Syntax

- **[true/false condition] sequence-number: return-value: = message-name (parameter-list)**
 - true/false condition – determines if message is sent
 - sequence number – notes the order of the messages
 - return-value – value coming back to origin object from the destination object
 - message-name – camelCase name identifier. Reflects the requested service
 - parameter-list – the arguments being passed to the destination object
- Every element of a message is optional

OOD for *Create customer account*

• Extend input messages

1. From the DCD put objects on communication diagram
2. For each message, find primary object, ensure visibility, elaborate use case with all messages between objects
3. Name each message and add all required message elements

Understanding Sequence Diagrams

- Lifeline
 - The dashed line under the object which serves as an origin point and a destination point for messages
- Activation lifeline
 - The vertical box on a lifeline which indicates the time period when the object is executing based on the message
- Messages have origins and destinations
 - May be on lifeline or on object box
 - Return values may be dashed message arrow, or on same message

OOD with Sequence Diagrams

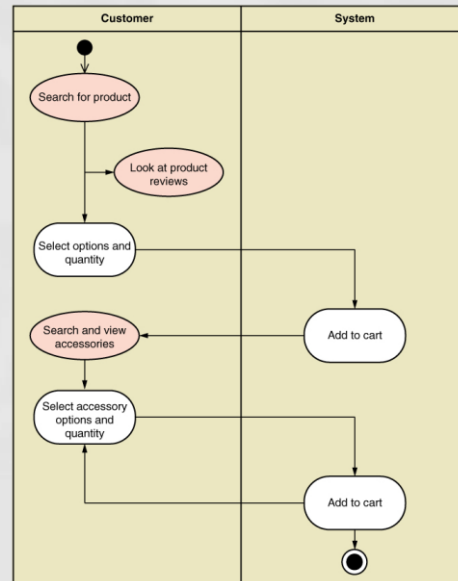

- Same process as with communication diagrams
- Choose a use case
 - Input models – activity diagram, SSD, classes
- Create first-cut DCD
- Extend input messages
 - Add all required internal messages
 - Origin and destination objects
 - Elaborate each message
- Add other layers as desired (view, data access)
- Update DCD

Example: *Fill Shopping Cart*

- First step in *addItem* message. Create a cart if first item in the purchase
- Note true/false test, two types of return values, named objects, activation lifelines, message origins and destinations

Example: *Fill Shopping Cart*

- Completion of *addItem* message.

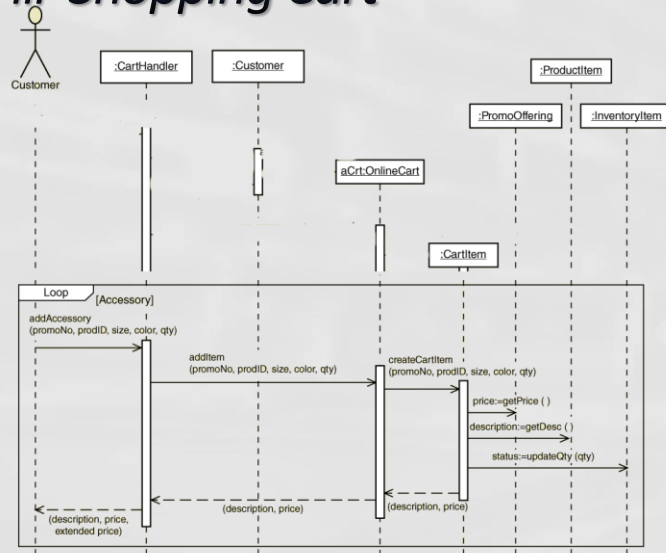

Example: *Fill Shopping Cart*

- Note origin and destination objects and visibility
 - createCart ()* – cart handler knows if first item
 - aCrt:=createCart()* – customer owns onlineCart
 - addItem()* – forwarded message
 - createCartItem()* – cartItem responsible for creating itself and getting values
 - getPrice()* – just returns the price
 - getDescription()* – just returns description
 - updateQty(qty)* – initiates updates

Example: *Fill Shopping Cart*

- *addAccessory* message (with objects and lifelines)

Guidelines

- From each input message
 - Determine all internal messages
 - Determine all objects (from classes) as origins or destinations
 - Flesh out each message with true/false conditions, parameters and returned values

Assumptions

- Perfect technology assumption
 - No logon or other technical issues
- Perfect memory assumption
 - No need to read or write data
- Perfect solution assumption
 - No exception conditions, no error handling

Multilayer Sequence Diagrams

- Add the view layer for input screens to handle input messages
- Add data layer to read and write the data

Data Layer

- Data layer for reading or updating existing persistent objects

Systems Analysis and Design in a Changing World, 7th Edition - Chapter 13
©2016. Cengage Learning. All rights reserved.

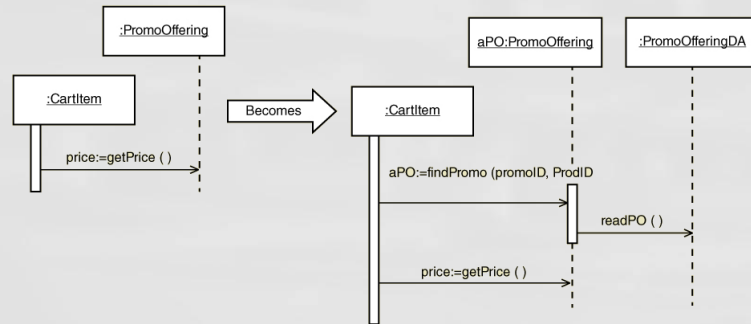

Data Layer

- Data Access to instantiate a new object – Two methods
 - Instantiate the object in memory, the object invokes the data access to get any required persistent data
 - Send a message to the data access object, and it obtains the required persistent data and then instantiates the new object

Instantiating a New Object

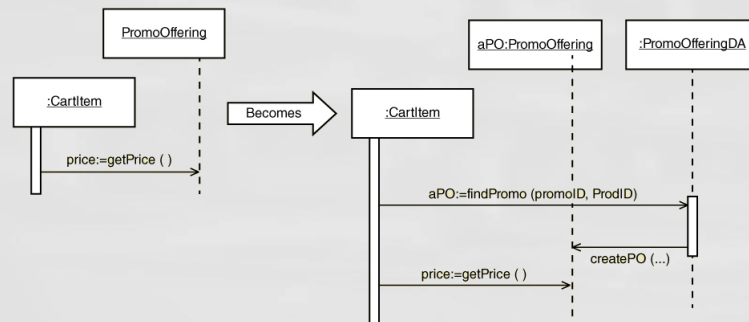

- Method 1. The instantiated object gets the data

Package Diagrams

- Can be used to define formal packages such as subsystems
- Can be used informally to group classes together for understanding
- Dependency relationship
 - A relationship between packages or classes within a package in which a change of the independent component may require a change in the dependent component. Indicated by dashed line. Read in the direction of the arrow, i.e. $A \rightarrow B$ is A depends on B.

Package Diagram

- Three-layer package diagram of classes in Figure 13-24
- Dependencies
 - View layer depends on Data Access layer
 - SearchItemWindow depends on ProductItem
 - etc.

Implementation Issues

Three Layer Design

- View Layer Class Responsibilities
 - Display electronic forms and reports.
 - Capture such input events as clicks, rollovers, and key entries.
 - Display data fields.
 - Accept input data.
 - Edit and validate input data.
 - Forward input data to the domain layer classes.
 - Start and shut down the system.

Implementation Issues

Three Layer Design

- Domain Layer Class Responsibilities
 - Create problem domain (persistent) classes.
 - Process all business rules with appropriate logic.
 - Prepare persistent classes for storage to the database.
- Data Access Layer Class Responsibilities
 - Establish and maintain connections to the database.
 - Contain all SQL statements.
 - Process result sets (the results of SQL executions) into appropriate domain objects.
 - Disconnect gracefully from the database.

Summary

- This chapter went into more detail about use case realization and three layer design to extend the design techniques from last chapter
- Three layer design is an architectural design pattern, part of the movement toward the use of design principles and patterns.
- Use case realization is the design of a use case, done with a design class diagram and interaction diagrams. Using interaction diagrams allows greater depth and precision than using CRC cards.
- Use case realization proceeds use case by use case (use case driven) and then for each use case, it proceeds layer by layer

Summary (continued)

- Starting with the business logic/domain layer, domain classes are selected and an initial design class diagram is drawn.
- The systems sequence diagram (SSD) from analysis is expanded by adding a use case controller and then the domain classes for the use case.
- Messages and returns are added to the interaction diagram as responsibilities are assigned to each class.
- The design class diagram is then updated by adding methods to the classes based on messages they receive and by updating navigation visibility.
- Simple use case might be left with two layers if the domain classes are responsible for database access. More complex systems add a data access layer as a third layer to handle database access

Summary (continued)

- The view layer can also be added to the sequence diagram to show how multiple pages or forms interact with the use case controller.
- The UML package diagram is used to structure the classes into packages, usually one package per layer. The package diagram can also be used to package layers into subsystems.
- Design patterns are a standard solutions or templates that have proven to be effective approaches to handling design problems. The design patterns in this chapter include controller, adapter, factory, and singleton
